### Referral Letter

**Referred To** : Dr Chern  
**Designation** : Consultant  
**Department** : Rehab med  
**Referred By** : Dr Saari  
**Designation** : Specialist  
**Department** : Rehab med  
**Main Complaint** : 3 years old girl

1. Pneumococcal meningitis complicated with subdural effusion (drained 3 x due to reaccumulation ) ??mild left hemipareisis in UMMC -- at 6-7 months old  
 - noted slight paucity of left UL  
 - now under UMMC neurosurgical f/up, last rv in late 2014  
 - nx neurosurg HKL TCA in may 2015 --> missed appt date  
 - eye assessment april 2014 ; bilat hyperopia with astigmatism, then defaulted  
 - hearing assessment last in march 2013 then defaulted

2. Epilepsy secondary to No 1 - currently in control, not on meds  
 - presented in Nov 2012- with fever and fits  
 - repetitive eye blinking  
 - On Syp CBZ 30mg bd --> stopped since april 2014  
 - has been fit free eversince

3. Global dev delay sec to above probs  
 - already registered OKU  
 - under attending regular physio/ OT & speech therapy

**Current Problem** : Parent brought to my clinic to get refferal to HRC for further intensive rehab. Mother plan to apply unpaid leave to learn and to take care her daughter. Otherwise all this long she was under peadiatrician follow up and our therapist.

She was born FT breech presentation with LSCS with BW 3.86kg  
 Postnatally uneventfull till age of 4/12 old had recurrent fever with cough.

Presently she is able to obey simple command like "salam"  
 GM : only half rolling, still unable to crawl  
 FM : able to hold object, not sustained  
 Speech : only a few word e.g nak, apa, tak tahu, ayah, kakak, adik  
 Social: sometime have interective with sister

Otherwise there is no more seizure, medication was stopped while she was 2 y/o

Clinically,
